TLE / ICT 9

First Quarter

Lesson 1

Our All-Knowing God,

We praise you for your firm love, for your powerful gentleness, for your forgiving grace. Thank you for the advancements that we continue to make, and while many of them have helped us take better care of the environment and live sustainable lives, we ask forgiveness for the human inventions that have destroyed the peace we used to have on earth. Merciful God, we also ask for forgiveness and pardon for all our sins and transgressions. With this technology prayer, we ask for your supreme blessing that any new inventions will be used for good and pure purposes, not for evil and sin. Guide us as we continuously learn how to use these advancements for our benefit in the most righteous ways. Let no man use it for ill intent, and may all of us utilize it to help each other and spread kindness and preach your word to whatever religion we might be and to all nations. Amen.

Hyperlink/s

- is a reference link that allows you to navigate to another page of the same document or to another document
- any navigational element of a web page
- may be represented by a colored text with an underline or with an image
- are enclosed between ***<a></a>*** anchor tags which will specify the target URL to an ***href*** (hyperlink reference) attribute in the opening tag.

Each web page hyperlink is sensitive to three interactive states

- Hover – gaining focus, the cursor is placed over the hyperlink
- Active – retrieving the linked resource, the user clicks the hyperlink
- Visited – the linked resource has previously been retrieved

Three Types of Hyperlinks

- Absolute URL – links to a page on a different web server
- Relative URL – links to a page on the same web server
- Named anchor – links to a different location on the same web page.

Note: A link does not have to be text, it can be an image or any other HTML element.

Web server - is a software and hardware combination that processes requests and delivers web content, like webpages, images, and videos, to users over the internet.

Anchor – term used to define a hyperlink.

Creating a Link from one page to another

- We will now learn how to create anchors that allow viewers to go to another Web page or file.
- Anchors can also be made to make email hyperlinks.
- Hyperlinks are clicked in order for viewers to jump to a page specified in it.
- Anchors can be made thru the container tag <a></a> and setting the value of the attribute href as the target destination page.

Syntax: *<a href="url">link text</a>*

<a href="url">link text</a>

Most important attribute

Part that is visible to the reader

Attributes for <a></a>

1. href – Indicates the target of the anchor. Indicates the link's destination

   Example: *<a href="sampleParagraphs.html">*
   Click this to learn about paragraphs again!</a>

2. target – Indicates the behavior the Web browser will carry out.

   Example: *<a href="sampleParagraphs.html"*
   target="blank"*>Click this to learn about paragraphs again!</a>*

Attributes for <a></a>

3. name – Assigns a name to the anchor defining an internal bookmark of the page.
   Example: *<a href="sampleParagraphs.html"* ***name="paragraph"****>Click this to learn about paragraphs again!</a>*

By default, links will appear as follows in all browsers:

An ***unvisited link*** is underlined and blue

A ***visited link*** is underlined and purple

An ***active link*** is underlined and red

Target Attribute

Target attribute indicates what the Web browser will do when the hyperlink is clicked. Below describes what each value does:

- **blank** – the value of the href attribute or target URL will be opened in a new window.
- **_self** – the value of the href attribute or target URL will be opened within the same frame.
- **_parent** – the value of the href attribute or target URL will be opened in the parent frameset.
- **_top** – the value of the href attribute or target URL will be opened in the full body of the window.

Accessing links via keys

There are three ways to access the target of a hyperlink:

- Pointer – a mouse or similar device places a screen pointer over a hyperlink, then the user clicks to access its target.
- Tab – repeatedly hit the Tab key to successively focus on each hyperlink in turn, then hit Return to access the target of the currently selected hyperlink.
- Access key – hit a designated character key to focus on a particular hyperlink, then hit Return to access the target.

hyperlink.txt

File Edit View

Sample code

```
<!DOCTYPE html>
<html>
<head>
  <title>Harry Potter</title>
</head>
<body>
  <h1 align="center"><font color="blue">All about Harry Potter</font></h1>
  <hr align="center" size="15" width="700" color="violet">
  <font size="7">
  <ul>Harry Potter Books:
  <li><a href="C:\Users\username\Desktop\Grade 9 files\codes\harry potter 1.jpg">Harry Potter 1</a></li>
  <li><a href="C:\Users\username\Desktop\Grade 9 files\codes\harry potter 2.jpg">Harry Potter 2</a></li>
  <li><a href="C:\Users\username\Desktop\Grade 9 files\codes\harry potter 3.jpg">Harry Potter 3</a></li>
  </ul>
  </font>
</body>
</html>
```
